Hands up if you wrote something with AI this week.

Keep it up if you could explain every line.

Without the AI.

AI knows the facts.
Your people know why.

Facts

You can look them up.

The AI has all of them.

Knowledge

Why we do it this way, for this client.

It lives in one head.

A payroll consultant and an AI

AI

“I’ll email all 240 employees about the payroll correction.”

CONSULTANT

“No, call their HR director first, because last time she heard it from her own staff and they nearly left us.”

No document has this. No search finds it.

Then they close the tab.

And it’s gone.

Every knowledge tool trusts the document and its owner.

But the AI wrote the document. The owner pressed enter.

The author is no longer the expert.

Unless.

Nobikos

Say it out loud.

No, because.

We keep the one sentence where your expert tells the AI why it’s wrong. With their name on it.

DEMO

Ask it. Get the why.

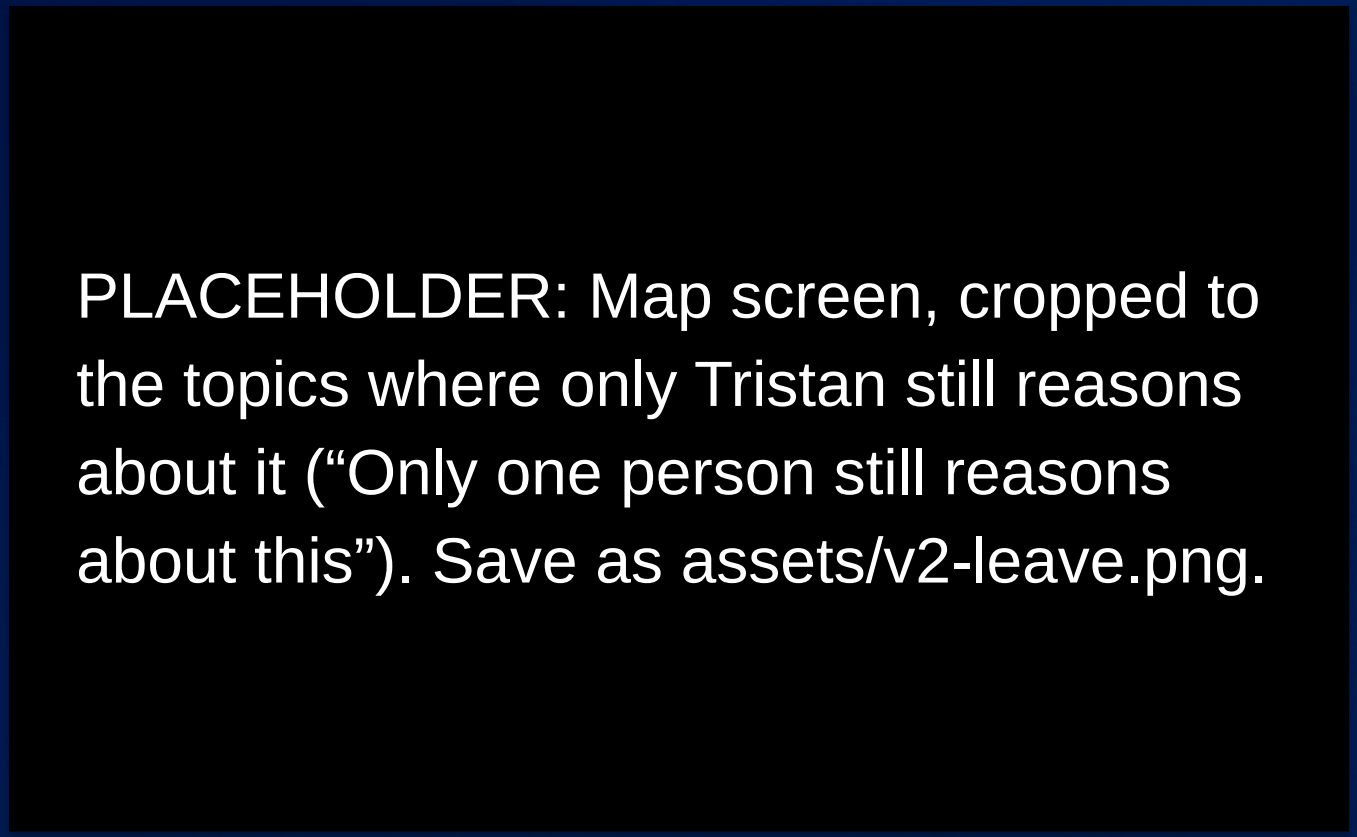

PLACEHOLDER: Ask screen, cropped to the answer card only. Question: “Can I email the employees about the payroll correction?” Answer: Tristan, “corrected the AI”, today, with his quote about calling the HR director first. Save as assets/v2-ask.png.

The answer is a person’s own words, not a document.

DEMO

Say Tristan goes on paternity leave on Monday.

What does only he know?

See what leaves with him, before he leaves.

DEMO

A fact without a why? Ask a human.

In the system: this client
is paid on the 23rd,
not the 25th.

Nobody recorded why.

Nobikos asks the one person
who changed it.

PLACEHOLDER: Gaps board or call, cropped to one item: a change without a why, the question to the person who made it (“Was that because...?”) and their answer in their own words. Save as assets/v2-askback.png.

AI guesses never count. Only their own words do.

You won’t notice it. Until it matters.

Nobody writes a document.
Nobikos listens for “no, because”
in the AI chats you already have.

It only asks you something
when you’re the last one who knows why.

How it works

1 Catch

the “no, because” in AI chats

2 Weigh

who reasoned, and how recently

3 Ask back

when only one person knows

4 Answer

in Slack, by voice, in your AI

IN TEN YEARS

AI writes the document.

AI reads the document.

AI answers from the document.

AI slop, with AI slop as its source.

2006. Jan builds the payroll mainframe.

For twenty years it just works. Every question goes to the AI.

Last year, Jan retired.

Tonight, 03:12. A security incident.

Who still understands this system?

Nobody.

Zero or one.

Nobikos finds every system, process and client that zero or one people still understand.

Before the incident. Before the retirement. While there’s still someone to ask.

Future-proof for the biggest workforce transformation of our time.

Remember the hands that went down?
That’s the why your company loses, every day.

AI knows what.
Your people know why.

Nobikos keeps the why.

Nobikos
